
Medically Tailored Meals (MTM)

Fully prepared meals, typically home-delivered, tailored by a Registered Dietitian Nutritionist (RDN)

Goal: therapeutic meals for patients with high clinical need and/or limited ability to prepare food

Clinical intent

- Provide ready-to-eat meals designed to meet clinical requirements and tailored to the patient's health needs (e.g., diabetes with CKD)
 - Stabilizes nutrition quickly when shopping and cooking are not reliable
 - Improve food security, diet quality, while reducing healthcare utilization
-

When to consider

- High clinical risk, acute health event and/or recent hospital use, or significant physical or ADL limitations
 - Poor diabetes control with high social risk and difficulty preparing meals independently
-

Program Essentials

- Meals designed by an RDN with program team reassessment every 3-6 months
 - Align MTM with complementary support (e.g., MNT)
 - Coordination with wider care team where applicable
-

Design

Dose	Duration	Distribution
10 meals/week	3-6 months with reassessment as needed	Home delivery; in-clinic or community pick-up models used as appropriate

Referral & workflow

- Screen for limitations in activities of daily living and other barriers
 - Reassess at 3-6 months with continuation or step-down support plan (e.g., transition to MTG or MNT) based on diabetic control and social needs/risks
-
